Geokhimiya berilliya i geneticheskiye tipy berilliyevykh mestorozhdeniy (Geochemistry of Beryllium and Genetic Types of Beryllium Deposits) Moscow, Izd-vo AN SSSR, 1960. 328 p. Errata slip inserted. 2,000 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Institut mineralogii, geokhimii i kristallokhimii redkikh elementov.

Resp. Ed.: K.A. Vlasov, Corresponding Member, Academy of Sciences USSR; Ed. of Publishing House: L.S. Tarasov; Tech. Ed.: T.P. Polenova.

PURPOSE: This book is intended for researchers in geology and geochemistry.

COVERAGE: The author presents the results of his research on beryllium and analyzes the work of Soviet and other scientists in this field. On the basis of the data, he creates a more complete picture of the behavior of beryllium in the formation processes of rocks and mineral deposits. Contributions of Soviet scientists M.V. Kur'menko, Ye.I. Semenov, V.S. Sobolev, A.S. Povarennykh, N.V. Belov and his student Yu.A. Pyatenko, and those of L.L. Shilin of the ISEM.

AUTHORS: Beus, A. A., Sitnin, A. A.

TITLE: Geochemistry of tantalum and niobium in the hydrothermal-pneumatolytic process

PERIODICAL: Geokhimiya, no. 3, 1961, 209-214

TEXT: The geochemical behavior of tantalum and niobium, specially in pneumatolytic-hydrothermal deposits, has not been sufficiently clarified yet. A. Ye. Fersman stated (Ref. 1: A. Ye. Fersman, Geokhimiya (Geochemistry), v. 4, Izd. AN SSSR, M., 1939) that niobium and tantalum did not enter into pneumatolysis, which opinion is shared by A. I. Ginzburg. Contrary to that, the authors come to the following conclusions based on their own investigations especially in Eastern Siberia: Tantalum and Niobium are characteristic elements of high temperature-, postmagmatic processes which are connected with granites. Their geochemical history can be followed from the state of early sodium metasomatism (early albitization) over greisenization up to the formation of high temperature quartz veins. Owing to the peculiarities of postmagmatic metasomatism two types of granites can be distinguished with

Geochemistry of ...

reference to the behavior of niobium and tantalum. Albitized granites of the alkali series contain columbite and pyrochlorite; tantalum plays a small part, the ratio Ta_2O_5/Nb_2O_5 is 0.1-0.2. Columbite, tantalocolumbite and microlite appear in albitized and greisenized granites of the acid and ultra-acid series, the tantalum concentration rises in individual cases to the 10-20 fold of the mean value for granites (0.0004% according to Rankama-Sahama), the ratio Ta/Nb rises to 0.25-0.50. Behavior and differentiation of niobium and tantalum are most strongly pronounced by the pneumatolytic-hydrothermal process in the greisen state. This is explained by different mobility and stability of the acidic complexes, specially of the fluorine complexes, which are present in the greisen solutions. The high tantalum concentration in the apical parts of albitized and greisenized granites which is 40-100 times higher than the tantalum content in normal granites, develops mainly thereby. The behavior of tantalum and niobium during post-magmatic metasomatism of granites has a lot in common with the behavior during metasomatism of granite pegmatites. However, tantalum and niobium are concentrated to a greater degree during metasomatism of granites, while the concentration is generally about equal in both cases. M. V. Kuz'menko

AUTHOR: Beus, A. A.
TITLE: Variations, in ore-fields, in the hydrothermal-pneumatolytic deposits of rare elements
PERIODICAL: Referativnyy zhurnal. Khimiya, no. 1, 1962, 123-124, abstract 1056 (Sov. geologiya, no. 4, 1961, 114-126)

TEXT: Geochemical investigation of a considerable number of deposits in the USSR has enabled four groups of metasomatic rare element ores to be isolated in granitoids, and in the various varieties of enclosing rocks. Particularly high concentrations of rare elements form during two types of metasomatic process, caused by the action of high-temperature post-magmatic emanations and solutions: albitization (Na-metasomatism) and greisenization (the process of high-temperature acid leaching, accomplished by F-K-metasomatism). Li and Rb are concentrated in zinnwaldite-containing albitized granites and greisens. Nb and Ta (in columbite, pyrochlore, microlite and hetchetolite), Zr (in malacon and zirkelite) and Be (in beryl) are concentrated in ✓

Variations, in ore-fields, in the ...

albitized and greisenized granites. Beryllium mineralization is closely associated with greisens of various compositions and quartz-greisen veins. Metasomatic rocks containing fluorite, among carbonate rocks, have typically high contents of Be (chrysoberyl, phenacite, etc.), Li (Li-margarite) and Sn (cassiterite). TITLE: Application of electron microscope and x-ray analyses methods
for investigating crystalline glass materials

SOURCE: AN SSSR. Doklady*, v. 154, no. 2, 1964, 427-429

TOPIC TAGS: glass analysis, electron microscope analysis, x-ray
analysis, crystalline glass, glass sieve, crystallization kinetics

ABSTRACT: The joint use of electron microscope analysis and x-ray
analysis gives valuable information about the structure of new
crystalline glass materials, permits the study of crystallization 15
kinetics, and permits following the composition-structure-properties
relationships. In the study of glass sieves, for instance, it is
possible to identify the crystals on the microphotograph and deter-
mine their size. The function of the crystallization temperature and
of the original glass composition on the structure and phase composi-
tions of the crystalline glass can be observed. "Material 3P was
synthesized by Aspirant Z. Zhitkevich."

Abstract : Report on the results achieved by using as fertilizers phosphorite or apatite treated with hydrochloric, sulfuric, or nitric acid. Also describe experiments on the use of phosphorite combined with moist superphosphate. In view of the good results obtained by using phosphorites partly decomposed with acid, in the manner described, recommend that this process be applied on a plant scale. ABSTRACT: The article analyzes and discusses the problem of fast-acting exciter regulation in a system of synchronous machines operating in parallel in a tie-network. The optimum regulation to maintain stability during disturbances is determined by calculations based on the relation between change of excitation voltage and the rate of change of load angle. Thus a simplified method is derived for calculating the rotor oscillations during positive or negative high-speed regulation after a short-circuit. The results are applicable to regulator design for maintaining stability, i.e. to establishing the optimum duration of positive-regulator action, also the relative effects of load angle speed and acceleration upon the exciter voltage.

"Selected Problems in the Pathology of Salivary Glands."

Warsaw, Polski Tygodnik Lekarski, Vol 17, No 47, 19 Nov 62,
pp. 1843-1846.

Abstract: Author points to our insufficient understanding of the connection between salivary gland and other diseases, and calls for a team of specialists to undertake a systematic investigation of this problem. She reviews the various types of salivary gland diseases and their connection with the main classes of diseases, such as infectious, post-operative, internal, nervous, glandular, and metabolic disturbances. Of the 15 references, one (i) is Polish, one (1) French, five (5) English, and eight (d) German.

TITLE: Compressor for Working with Precious Gases

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, No. 5,
pp. 143 - 144

TEXT: The necessity arises of compressing rare or particularly precious gases (for instance, gases of a certain isotope composition). In such cases it is particularly desirable to have a low volume of the compressor equipment. Furthermore, hermeticity of the equipment is essential. The authors have developed a compressor that satisfies these requirements and is based on the "Aktivist" model aeroplane engine (produced by Zeiss, E. Germany) of 2.5 cc capacity. The engine was additionally fitted with a compression valve, lubricating equipment, the carburetter was modified and the shaft provided with double oil seals. The air-cooling was substituted by water-cooling and the cylinder was modified somewhat to reduce the dead volume. The inlet valve is a disc valve of the resonance type. By means of this compressor pressures of about 40 atm were achieved at 3 000 rpm and at compression to

Card 1/2

S/120/60/000/005/045/051
E073/E335

Compressor for Working with Precious Gases

10 atm the nitrogen delivery was about 250 litres/hour. When operating as a model engine the rated rpm are 15 000 to 20000.

The scavenging space does not exceed 5 cm^3 and the amount of infiltrating air does not exceed $10 \text{ cm}^3/\text{hour}$, so that its content in the gas will not exceed 5×10^{-3} mol. This high figure of compression is realised without piston rings and the performance of the compressor is not lowered if used with hydrogen. The volume efficiency is 65 to 70%. The compressor has been tested under various conditions for various gases and has proved itself for long-duration operation. This compressor will be marketed by Zeiss of E. Germany. Preliminary experiments have established the possibility of using a higher inlet pressure (1 to 2 atm) and in this case gas pressures of up to 70 atm were obtained with a delivery of 400 litres/hour. There is 1 figure.

TITLE: Liquefied Gas Level Indicator

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, No. 5,
pp. 144 - 145

TEXT: The system consists of a manometer M, a capillary tube K and a tank Σ attached to it. When necessary, an additional tank P is provided (Figs. 1 and 2). The whole system, which is sealed off, is filled with the appropriate gas. When the tank Σ is placed in the liquid so that the liquid level is at A (Fig. 1) the gas in the system condenses, while when the liquid level falls down to B the condensed gas inside the system is heated through the capillary tube and rapidly evaporates, thus re-establishing the original pressure. This is due to the fact that only when the tank Σ is in contact with the liquid is the heat transfer sufficiently large to cause the condensation. Small changes in the liquid level give rise to large changes in the pressure in the system. The second version of the instrument is shown in Fig. 2 and does not include the lower tank. In this case

Card 1/2

S/120/60/000/005/046/051
E032/E314

Liquefied Gas Level Indicator

the condensation takes place in the tube K, which is in contact with the liquid. In this case, the amount of condensed gas depends on the external level. Under suitable conditions (appropriate thermal conductivity of the material of the tube) the liquid levels inside and outside the capillary are the same. Thus, the amount of condensed gas in the capillary is proportional to the length h of the capillary in the liquid. Perfect-gas laws can then be used to derive an expression for the residual gas pressure in the system as a function of h. The instrument can be so designed that the pressure depends linearly on h. The device is subject to German patent No. WP 42 e/59221. There are 2 figures.

TITLE: Lectures and Courses (Lektsii, Doklad)

PERIODICAL: Grazhdanskaya Aviatsiya, 1957, Nr 5, p. 30 (USSR)

ABSTRACT: The Uzbek Territorial Administration employs 52 lecturers and instructors, among them, Com. Mostovskiy, an engineer, lectures on jets; comrade Rubin, on instrument flying; com. Ovchinnikov, on flight economy. Last year, 433 lectures were held within the Uzbek Territorial Administration. In the political instruction department of the Tashkent Airport, moving pictures supplement lectures. Comrade Krasnoborodkin reported on flight safety, comrade Kaloshin on flights in storms. A department of technical propaganda of the air terminal (not specified) organized a series of lectures on foreign experience. Recently, a lecture on servicing the Viscount aircraft was delivered in the LERM by comrade Pavlovskiy.

TITLE: Stability of poly-3-methylbutene-1

SOURCE: Plasticheskiye massy*, no. 4, 1964, 3-6

TOPIC TAGS: polymethylbutene, stability, differential thermal analysis, methylbutene polymerization, thermogram, exothermic effect, endothermic effect, amorphous, crystalline, isotactic polymer, stabilizer, polymer oxidation

ABSTRACT: The stability to atmospheric oxidation of poly-3-methylbutene-1 was studied by differential thermal analysis. The polymer was produced by polymerization of 3-methylbutene-1 on the $\text{Al}(\text{C}_2\text{H}_5)_3$:
 TiCl_4 system (1.5:1). The thermogram of the polymer sample in air shows a series of exothermic effects above 120°C and an endothermic peak at 260°C. In the thermogram in argon the exothermic effects are absent but there is a series of endothermic effects, associated with changes in the structure of the polymer macromolecules.

Card 1/2

ACCESSION NR: AP4028542

Comparison of the amorphous, slightly crystalline and crystalline or isotactic fractions (structures confirmed by x-rays) of the polymer shows the highly crystalline material is oxidized most on heating. The effect of the addition of various amounts of ionol (2,6-di-tert. butyl-4-methylphenol) was studied, and it was found that the intensity of the exothermic effects was reduced with increasing amounts of stabilizer, up to 2% ionol when there is almost no oxidation of the polymer. TITLE: Polymerization of 3-methyl-1-butene in the presence of complex or gano-metallic catalysts

SOURCE: Neftekhimiya, v. 4, no. 6, 1964, 727-734

TOPIC TAGS: methylbutene, dehydration catalyst, polymerization catalyst, isopentyl alcohol, fractionation polymerization, polymer physical property, olefin polymorization, heteroorganic catalyst

ABSTRACT: The preparation of 3-methyl-1-butene by dehydration of isopentyl alcohol (b. p. 128-132C, $n_{D}^{20} = 1.4080$, $d_{4}^{20} = 0.811$) is described and the conditions of polymerization and fractionation are given. The intrinsic viscosity, melting point and glass transition temperature were determined for 3-methyl-1-butene polymers. For crystalline polymers the glass temperature is important because the valuable complex of properties determined by the nature of the material appears only in the temperature range between the glass transition and melting points. The polymerization was influenced considerably by the molar ratio of the catalyst components. Thus, the highest yield of solid product was obtained at a $\text{Al}(\text{C}_2\text{H}_5)_3$: TiCl ratio of 2 at 110C in 10 hours and a catalyst

Card 1/2

L 13813-65

ACCESSION NR: AP4047684

concentration of 5% based on the monomer. The content of isotactic portion in the polymer was relatively independent of the temperature of polymerization. The resulting polymer has a M. P. of 230-240°C, 80% isotactic portion, and an intrinsic viscosity of 0.7. The glass transition temperature is 60°C according to the thermomechanical curve. The solubility data obtained in a stream of pure argon are tabulated (in benzene, toluene, xylene, decalin, tetralin, ditolylmethane, dicumylmethane, and kerosene). The structure assumed for the polymers was confirmed by infrared spectra. "The authors thank B. A. Krentsel' for his assistance, M. M. Kusakov and M. V. Shishkina for taking the infrared spectra and I. Tsarevskaya for the determination of the thermomechanical properties of the polymers; M. I. Leonova and M. N. Shvarts also took part in the work." TITLE: A unit for measuring low temperatures operating in combination with a semiconductor transducer

SOURCE: Izmeritel'naya tekhnika, no. 1, 1967, 42-44

TOPIC TAGS: resistance thermometer, temperature gage, temperature transducer, LOW TEMPERATURE

ABSTRACT:

A device has been developed for remote measurement of low temperatures under conditions of industrial noise. It is designed to operate in combination with a semiconductor thermometer in which the relationship between temperature and resistance has an exponential character. The measuring circuits are based on the use of a semiconductor transducer in the master frequency

Card 1/2

UDC: 536.531

ACC NR: AP7006167

circuit of a harmonic RC oscillator. The resistance thermometer is made of a zinc-and gallium-doped germanium crystal measuring $0.15 \times 0.15 \times 3$ mm with two fused indium contacts. The crystal is enclosed in a copper capsule 18 mm long and 3 mm in diameter. The thermometer had a time constant of 0.15 sec at -20.4°K. The basic measurement error of the unit is caused by the frequency instability of the RC oscillator, by changes in the capacitance of the input cable, and by the amplitude instability of pulses arriving at the integrating circuit. Maximum measurement error is estimated at 0.2 deg. Orig. art. has: 4 figures. [JR]

of Siberia

Orig Pub : Tr. Dal'nsvost. politekhn. in-ta, 1954, No 43, 81-91

Abstract : Work has been carried out on identification of minerals of the lepto-chlorite group from sedimentary iron ores of Precambrian(?) Period. On the basis of field observations, microscopical, chemical and thermal analyses it was ascertained that the chlorites under study are characterized by high content in FeO (21.27-33.38%) to the detriment of Mg, Mn and Ca. Two characteristic varieties have thus become apparent: 1) Thuringitic of approximate formula

TITLE: Diagnostic Features in the Clay Products From the
Weathering of Leptochlorites (K diagnostike glinistykh
produktov vyvetrivanija leptokhloritov)

PERIODICAL: Tr. Dal'nevostochn. politekhn. in-ta, 1954, Nr 43,
pp 93-95.

ABSTRACT: The clay minerals from the Siberian leptochlorite-hematite ores were formed during weathering of leptochlorites. Within the ore, less thoroughly affected by weathering, all transitions are observed from typical green leptochlorite through pale green material to an anisotropic clay mineral. Scales of the latter mineral have the following properties: $Ng = 1.576 \pm 0.502$ and $Np = 1.562 \pm 0.502$. The hardness is 1.5 to 2.0 and the specific gravity is 2.51. The chemical composition (in percent) is SiO_2 46.27, TiO_2 none,

· Diagnostic Features in the Clay Products From the (Cont.) 15-57-1-580

Al_2O_3 38.84, Fe_2O_3 2.18, MnO none, CaO 0.47, MgO 0.18, H_2O^+ 11.30, H_2O 0.9; total 100.14. The formula is $2.02 \text{SiO}_2 \cdot \text{Al}_2\text{O}_3 \cdot 0.035 (\text{CaMg})_0 \cdot 1.64 \text{H}_2\text{O}$. This formula is distinguished from the theoretical formula for kaolinite by an insufficiency of water. The thermal curve, in addition to an endothermic effect at 500° to 580° and an exothermic effect at 960° characteristic of kaolinite, shows other effects at 700° to 770° and at 800° to 850° which indicate a genetic relationship of the mineral leptochlorites and hydromicas. The author believes that the investigated clay mineral may be a hydromica similar to kaolinite in composition.
